

Method	Short Description	Syntax	Simple Example
<code>contains()</code>	Checks if a string contains a specific sequence of characters. Returns <code>true</code> or <code>false</code> .	<code>string.contains(sequence)</code>	<pre>String text = "Hello World"; System.out.println(text.contains("World"));</pre> Output: <code>true</code>
<code>endsWith()</code>	Checks if a string ends with a specified sequence of characters.	<code>string.endsWith(suffix)</code>	<pre>String text = "Hello World"; System.out.println(text.endsWith("World"));</pre> Output: <code>true</code>
<code>startsWith()</code>	Checks if a string starts with a specified sequence of characters.	<code>string.startsWith(prefix)</code>	<pre>String text = "Hello World"; System.out.println(text.startsWith("Hello"));</pre> Output: <code>true</code>
<code>indexOf()</code>	Finds the position/index of a character or substring. Returns <code>-1</code> if it is not found.	<code>string.indexOf(value)</code>	<pre>String text = "Hello"; System.out.println(text.indexOf("e"));</pre> Output: <code>1</code>
<code>isEmpty()</code>	Checks whether a string has no characters. Returns <code>true</code> if its length is 0.	<code>string.isEmpty()</code>	<pre>String text = ""; System.out.println(text.isEmpty());</pre> Output: <code>true</code>
<code>trim()</code>	Removes leading and trailing whitespace from a string.	<code>string.trim()</code>	<pre>String text = " Hello "; System.out.println(text.trim());</pre> Output: <code>Hello</code>

<code>replace()</code>	Replaces occurrences of a specified character or sequence with another.	<code>string.replace(old, new)</code>	<pre>String text = "Hello"; System.out.println(text.replace("H", "J"));</pre> Output: Jello
<code>toCharArray()</code>	Converts a string into an array of characters (<code>char[]</code>).	<code>string.toCharArray()</code>	<pre>String text = "Hello"; char[] letters = text.toCharArray(); System.out.println(letters[0]);</pre> Output: H
<code>nextLine().charAt()</code>	<code>nextLine()</code> reads an entire line of input, while <code>charAt()</code> gets a character at a specific index.	<code>scanner.nextLine().charAt(index)</code>	<pre>Scanner sc = new Scanner(System.in); char letter = sc.nextLine().charAt(0); System.out.println(letter);</pre>
<code>valueOf()</code>	Converts a value, such as a number, into its String representation.	<code>String.valueOf(value)</code>	<pre>int number = 100; String text = String.valueOf(number); System.out.println(text);</pre> Output: 100
